Wed, Feb 24

Pre-lecture exercises will not be collected for credit. However, you will get more out of each lecture if you do them, and they will be referenced during lecture. We recommend **writing out** your answers to pre-lecture exercises before class. Pre-lecture exercises usually should not take you more than 30 minutes.

Consider the Fibonacci numbers, defined by

$$F(0) = F(1) = 1$$

and

$$F(n) = F(n-1) + F(n-2).$$

For example, the first several Fibonacci numbers are:

Consider the following divide-and-conquer algorithm to compute Fibonacci numbers.

def Fibonacci(n):

```
if n == 0 or n == 1:
    return 1
return Fibonacci(n-1) + Fibonacci(n-2)
```

- 1. Is this algorithm correct?
- 2. What is the running time of this algorithm? You don't need to find it exactly, but is it O(n)?  $O(n^2)$ ?  $O(n^3)$ ?  $O(n^c)$  for any constant c?
- 3. How could you make this algorithm better?
